

## Center and Rear Brake Cable

Job No.
42-19

On Models 180 to 220 SE the removal and installation procedures for center and rear brake cable are the same as on Model 190.

## Adjustment of Brakes

Job No.
42-20

### A. Brakes with Mechanical Adjustment

1. After jacking up the car check whether all wheels turn freely.

**Note:** If a wheel is difficult to turn, determine the cause (seized up brake shoes, wheel brake cylinder or hand brake cable).

2. On each wheel turn the adjustment bolt (eccentric) outward until the brake shoes contact the brake drums, i. e. until considerable resistance is felt when turning the wheel.

**Note:** The brake shoes should only be adjusted when the brake drums are cold.

3. Carefully back out the adjustment bolt (eccentric) until the wheel turns freely.
4. Depress the brake pedal and check whether the wheels turn freely when the pedal is released.
5. After a trial run check again whether the brake shoes are properly released.

### B. Adjustment of Hand Brake

The adjustment procedure for the hand brake is the same as on Model 190.
